

Technological and socio-economic solutions to reduce indoor air pollution in Nepal

1.9.2023-31.12.2026

The Smokefree Homes Nepal project is part of the Academy Programme for Development Research DEVELOP2 and funded by the Ministry for Foreign Affairs.

Background

- Residential biomass combustion (RBC) is one of the major causes of indoor air pollution in the Global South.
- Many rural Nepalese households use traditional stoves, leading to harmful particulate and gaseous emissions.
- This emissions pose serious health risks, particularly to women and children, contributing to over 18,000 deaths annually in Nepal.
- Emissions also have significant climate effects for example, black carbon particles emitted from Nepal transform easily to the central Himalayas causing melting of ice.

Main objectives

- Clarify the emission levels of Nepalese cooking stoves.
- Find the most effective, techno-economic, and socially acceptable measures to reduce emissions and lower the exposure for indoor air pollutants.
- · Develop mitigation models and emission inventories
- Produce information for the assessment of health and climate effects imposed by RBC emissions in Global South.

1st measurement campaign

- The experiments were performed in the small-scale combustion simulator at the University of Eastern Finland during May-October 2024
- Various appliances were tested, including traditional and improved cooking stoves from Nepal and camp stoves
- Water Boiling Test protocol was used, and the emissions and indoor air quality and exposure were measured

Save the date: 17th October 2024 Workshop in Kathmandu and online

This workshop will cover the following key topics:

- SmokeFreeHomes Nepal: Overview and impact
- **Emissions:** Measurement methods and results of first measurement campaign
- Health and Environment: Indoor and outdoor air quality
- Policy and Decision making: Emission inventory and challenges and opportunities implementing improved cooking stove solutions
